

## **EXPERIMENT 2**

### **TCP CLIENT-SERVER COMMUNICATION USING SOCKET PROGRAMMING IN PYTHON**

#### **Aim:**

To study and implement socket programming in Python for establishing communication between a client and a server using the TCP/IP protocol.

#### **Introduction:**

Socket programming is a method used for communication between two programs running on a network.

It allows a client and a server to send and receive data through network connections.

Python provides a built-in module called `socket` that supports both TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) communication.

#### **Algorithm:**

##### **Server:**

1. Import the `socket` module.
2. Create a socket object using `socket.socket()`.
3. Bind the socket to a host address and port using `bind()`.
4. Listen for incoming connections using `listen()`.
5. Accept a connection using `accept()`.
6. Receive data from the client using `recv()`.
7. Send a response to the client using `send()`.
8. Close the connection using `close()`.

##### **Client:**

1. Import the `socket` module.
2. Create a socket object using `socket.socket()`.
3. Connect to the server using `connect((host, port))`.
4. Send data to the server using `send()`.
5. Receive a response from the server using `recv()`.

6. Close the connection using close().

*Code:*

**SERVER:**

```
import socket

sockfd=socket.socket(socket.AF_INET, socket.SOCK_STREAM)
print('Socket Created')
sockfd.bind(('localhost',55555))
sockfd.listen(3)
print('Waiting for connections')
while True:
    clientfd,addr=sockfd.accept()
    receivedMsg=clientfd.recv(1024).decode()
    print("Connected with ",addr)
    print("Message Received from Client: ",receivedMsg)
    clientfd.send(bytes(receivedMsg,'utf-8'))
    print("Message reply sent to Client!")
    print("Do you want to continue(type y or n):")
    choice=input()
    if choice=='n':
        break
```

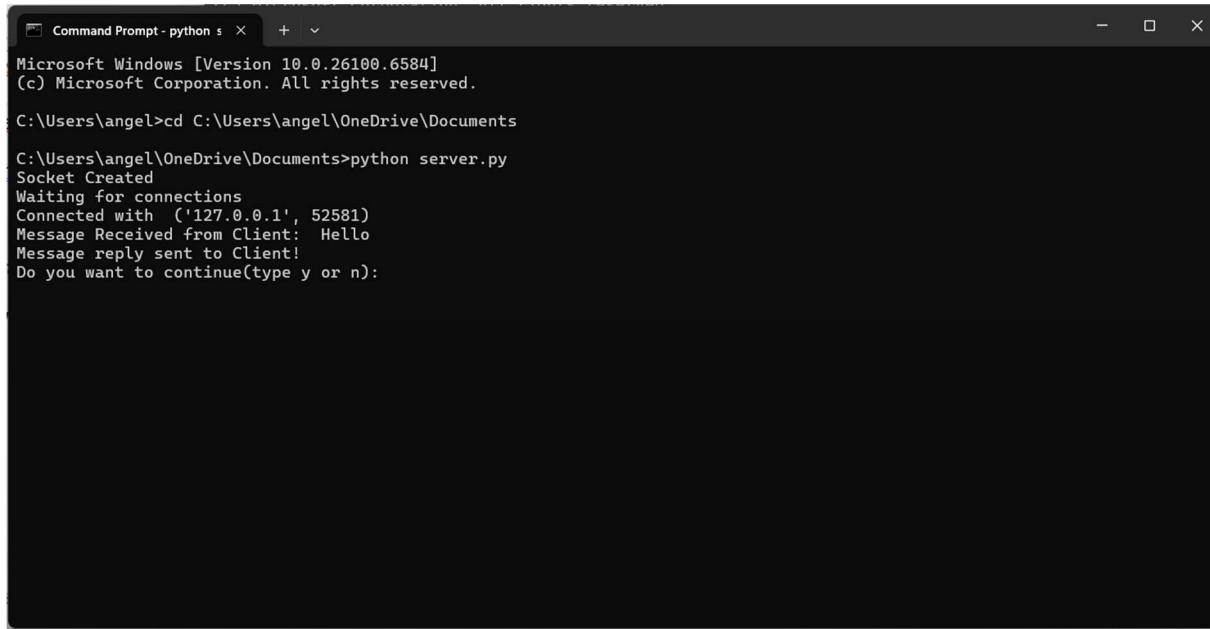

**CLIENT:**

```
import socket

clientfd=socket.socket(socket.AF_INET, socket.SOCK_STREAM)
clientfd.connect(('localhost',55555))
name=input("Enter your message:")
clientfd.send(bytes(name,'utf-8'))
print("Message Received from Server: ",clientfd.recv(1024).decode())
```

**Output:**

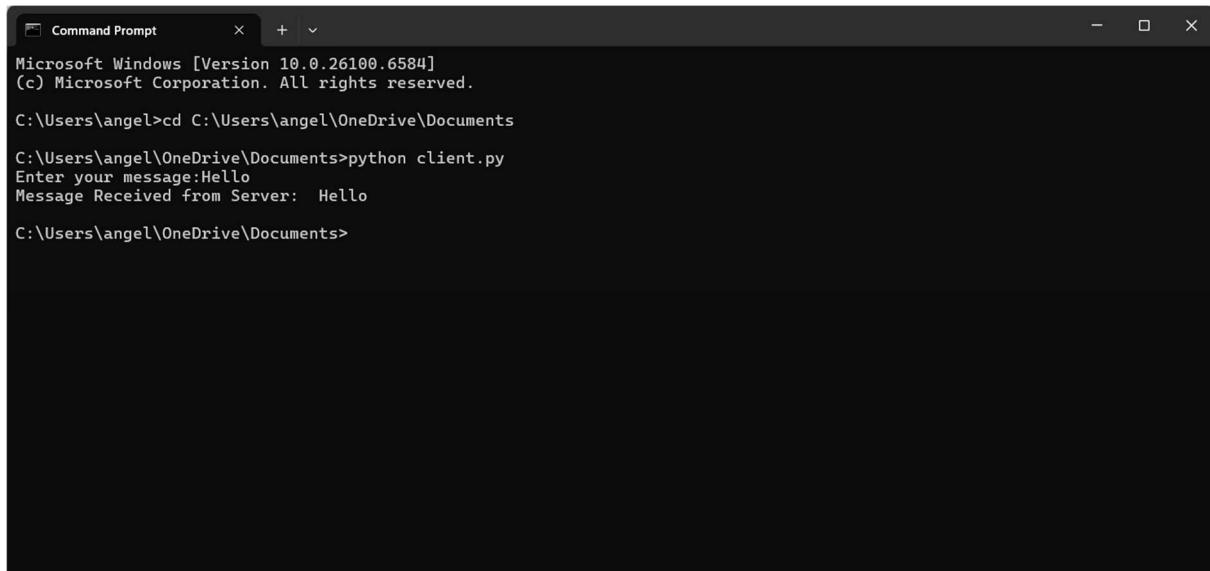

**Server:**

```
Microsoft Windows [Version 10.0.26100.6584]
(c) Microsoft Corporation. All rights reserved.

C:\Users\angel>cd C:\Users\angel\OneDrive\Documents
C:\Users\angel\OneDrive\Documents>python server.py
Socket Created
Waiting for connections
Connected with ('127.0.0.1', 52581)
Message Received from Client: Hello
Message reply sent to Client!
Do you want to continue(type y or n):
```

**Client:**

```
Microsoft Windows [Version 10.0.26100.6584]
(c) Microsoft Corporation. All rights reserved.

C:\Users\angel>cd C:\Users\angel\OneDrive\Documents
C:\Users\angel\OneDrive\Documents>python client.py
Enter your message:Hello
Message Received from Server: Hello
C:\Users\angel\OneDrive\Documents>
```

**Result:**

The implementation of socket programming in Python was successfully executed. A TCP connection was established between the client and the server, enabling successful message exchange.
